TYROSINE-PROTEIN KINASE TRANSMEMBRANE
RECEPTOR ROR2.
-!- SIMILARITY: Belongs to the Tyr family of protein kinases. ROR subfamily.
-!- SIMILARITY: Contains I frizzled (FZ) domain.
-!- SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
-!- SIMILARITY: Contains 1 kringle domain.

"Ror2, encoding a receptor-like tyrosine kinase, is required for cartilage and growth plate development.";
Nat. Genet. 24:271-274(2000).
-! FUNCTION: Tyrosine-protein kinase receptor which may be involved in the early formation of the chondrocytes. It seems to be required for cartilage and growth plate development.
-! CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
-! SUBCELLULAR LOCATION: Type I membrane protein.
-! SUBCELLULAR LOCATION: Type I membrane protein kinases. ROR
                                                                                                                                                                                                                                                                                                                                                                                                                   ENEL; ABO10384; BAA75491.1; -

-! - CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine prospate.
-! - SUBCELLULAR LOCATION: Type I membrane protein.
-! - SIMILARITY: Belongs to the Tyr family of protein kinases. ROR subfamily.
-! - SIMILARITY: Contains I frizzled (PZ) domain.
-! - SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
-! - SIMILARITY: Contains 1 kringle domain.

Protein Seq. Data Anal. 2:445-450(1989).

In protein Plasmin dissolves the fibrin of blood clots and acts as a proteolytic factor in a variety of other processes including embroyonic development, tissue remodeling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Graafian follicle. It activates the urokinase-type plasminogen activator, collagenase and several complement zymogens, such as Cl and C5. It cleaves fibrin, fibronectin, thrombospondin, laminin and von willebrand factor.

                                                                                                                                                                                                                                                             -!- ENZYME REGULATION: Converted into plasmin by plasminogen activators. both plasminogen and its activator being bound to fibrin. Activated with catalytic amounts of streptokinase.
-!- MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after discociation from the clot.
-!- MISCELLANEOUS: In the presence of the inhibitor, the activation involves only cleavage after Ags-580, resulting in 2 chains held together by 2 disulfide bonds Without the inhibitor, the activation involves also removal of the activation peptide.
-!- SIMILARITY: Belongs to peptidase family SI. Plasminogen subfamily.
                                                                                     Macaca mulatta (Rhesus macaque).

S1. Plasminogen subfamily

disulfide bond.
-!- SIMILARITY: Belongs to peptidase family
-!- SIMILARITY: Contains 4 kringle domains.

Isolation, Characterization and partial amino acid sequence of
lamprey plasminogen.";
Protein Seq. Data Anal. 5:207-211(1993).
-! FWOUTION: Plasmin dissolves the fibrin of blood clots and acts as
a proteolytic factor in a variety of other processes including embryonic development, tissue remodeling, tumor invasion, and inflammation.
-! CATALYTIC ACTIVITY: Preferential cleavage: Lys-|-Xaa > Arg-|-Xaa, higher selectivity than trypsin. Converts fibrin into soluble

MISCELLANEOUS: Thrombin can itself cleave the amino terminal
MISCELLANEOUS: Thrombin can itself cleave the amino terminal
fragment (fragment 1) of the prothrombin, prior to its activation
by factor xa.
SIMILARITY: Belongs to peptidase family S1.
SIMILARITY: Contains 2 kringle domains.

L. FUNCTION: Thrombin, which cleaves bonds after Arg and Lys,
converts fibrinogen to fibrin and activates factors V, VII, VIII,
XIII, and, in complex with thrombomodulin, protein C.
CATLIVITY: Perferential cleavage: Arg-|-Gly; activates fibrinogen to fibrin and releases fibrinopeptide A and B.
C. -- CATLIVITY: Expressed by the liver and secreted in plasma.
C. -- TISSUE SPECIFICITY: Expressed by the liver and secreted in plasma.
C. -- PTW: THE GAMMA-CARBOXVENTINMY EXSIDUES, WHICH BIND CALCIUM IONS,
RESULT FROM THE CARBOXVIATION OF GLUTAMYL RESIDUES
C. -- PTW: THE GAMMA-CARBOXVIATION WITH A NEGATIVELY
CHARGED PHOSPHOLIPID SURFACE, WHICH IS ESSENTIAL FOR THE CONVERSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE=92256895; PubMed=1349838;

-- PUNCTION: Plasmin dissolves the fibrin of blood clots and acts as a proteolytic factor in a variety of other processes including compressed and experience of ovolution it weakens the will and and inflammation; in ovolution it weakens the wills cited Graafian inflammation; in ovolution it weakens the wills of the Graafian or ollagenses and several complement zymogens, such as 13 and 13 octored inflammation; in ovolution it weakens the will and on willebrand factor.

-- CAPLIVITION activity in the complement zymogens, such as 2 and 2 and 2 octored factor selectivity than trypsin. Converts fibrin into soluble produce selectivity than trypsin. Converts fibrin into soluble produce selectivity than trypsin. Converts fibrin into soluble activators, both plasminogen and its activator being bound to infini. Gamon be activated by alpha 2-antiplasmin and than activators, both plasminogen and its activator being bound to infini. Cannot be activated by alpha 2-antiplasmin and therefore the contains at least 2 kringle domains.
